

Acquisitions-Purchasing

This module is a tool in B2B that increases efficiency and saves money in the organisation's acquisitions and purchasing process. The mere fact that it eliminates time-consuming, paper-based requisition procedures, means large and easily identifiable cost savings.

Acquisitions-Purchasing is an expansion module that when integrated with Nilex HelpDesk and Nilex Inventory makes it possible to fully control the life of an inventory item from the time of the planned acquisition through the time for its total use until it is phased out.

Registration

When the person responsible for purchasing receives a request for the acquisition of a certain inventory item, she/he searches on the intranet to see if any of the suppliers with whom the organisation has general purchasing agreements carries that which is sought.

The program also has a function that makes it possible to search for desired products and appropriate suppliers via the Internet if no general purchasing agreement exists.

It can also be used, for example, for checking that the conditions agreed upon are still the most advantageous alternative. The search path is saved so that it can be used on a later occasion.

Control

It is simple to control the whole acquisitions process from the point at which the need arises and the order is placed until the time that the goods are in place.

Depending on the organisation's size and internal routines, the individual employees can choose desired articles from existing supplier contracts or from appropriate suppliers on the Internet and "click" the order form to the appropriate purchasing department or directly to the supplier in question.

Nilex Acquisition-Purchasing ensures that the whole chain of activities is controlled, effective and streamlined.

Id number	Date	Name	Helpdesk staff	Supplier	Acquirer	Contact person 1	Invoice number	Cost	Delivery date
